1. CODE TEMPLATES

2. DATA STRUCTURES

2.1. Fenwick Tree.

2.1.1. Point Queries.

```

struct fenwick { ----- //f4
- vi ar; ----- //2b
- fenwick(vi &ar) : ar(_ar.size(), 0) { ----- //0d
-   for (int i = 0; i < ar.size(); ++i) { ----- //96
-       ar[i] += _ar[i]; ----- //ca
-       int j = i | (i+1); ----- //e0
-       if (j < ar.size()) ----- //36
-           ar[j] += ar[i]; } } ----- //c4
- int sum(int i) { ----- //78
-     int res = 0; ----- //bf
-     for (; i >= 0; i = (i & (i+1)) - 1) ----- //52
-         res += ar[i]; ----- //be
-     return res; } ----- //77
- int sum(int i, int j) { return sum(j) - sum(i-1); } ----- //2b
- void add(int i, int val) { ----- //ca

```

[illegible]

2.1.2. Range Queries.

2.2. Mergesort Tree.

2.3. Segment Tree.

2.3.1. Recursive (Point-update).

```

struct segtree { ----- //64
- int i, j, val; ----- //06
- segtree *l, *r; ----- //9d
- segtree(vi &ar, int _i, int _j) : i(_i), j(_j) { ----- //88
- if (i == j) { ----- //f1
-     val = ar[i]; ----- //ea
-     l = r = NULL; ----- //9f
- } else { ----- //e6
-     int k = (i+j) >> 1; ----- //50
-     l = new segtree(ar, i, k); ----- //57
-     r = new segtree(ar, k+1, j); ----- //d0
-     val = l->val + r->val; } ----- //ff
- void update(int _i, int _val) { ----- //28
- if (i == _i and _i == j) { ----- //b3
-     val = _val; ----- //62
- } else if (_i < i or j < _i) { ----- //0b
-     // do nothing ----- //b7
- } else { ----- //b9
-     l->update(_i, _val); ----- //92
-     r->update(_i, _val); ----- //c6
-     val = l->val + r->val; } } ----- //af
- int sum(int _i, int _j) { ----- //fe
- if (_i <= i and j <= _j) { ----- //06
-     return val; ----- //39
- } else if (_j < i or j < _i) { ----- //40
-     return 0; ----- //5a
- } else { ----- //2f
-     return l->sum(_i, _j) + r->sum(_i, _j); } } }; ----- //04

```

2.3.2. Iterative (Point-update and operation can be non-commutative).

```
struct segtree {
- int n;
- int *vals;
- segtree(int *ar, int n) {
-   this->n = n;
-   vals = new int[2*n];
-   for (int i = 0; i < n; ++i)
-     vals[n+i] = ar[i];
-   for (int i = n-1; i > 0; --i)
-     vals[i] = vals[i<<1] + vals[i<<1|1];
- void update(int i, int v) {
-   for (vals[i += n] = v; i > 1; i >>= 1)
-     t[i>>1] = t[i] + t[i^1];
- int query(int l, int r) {
-   int res = 0;
-   for (l += n, r += n; l < r; l >>= 1, r >>= 1) {
-     if (l&1) res += vals[l++];
-     if (r&1) res += vals[--r];
-   }
-   return res;
}
```

2.3.3. Lazy Propagation (Range-update).

```
struct segtree {
- int i, j, val, temp_val = 0;
- segtree *l, *r;
- segtree(vi &ar, int _i, int _j) : i(_i), j(_j) {
-   if (i == j) {
-     val = ar[i];
-     l = r = NULL;
-   } else {
-     int k = (i + j) >> 1;
-     l = new segtree(ar, i, k);
-     r = new segtree(ar, k+1, j);
-     val = l->val + r->val;
-   }
- void visit() {
-   if (temp_val) {
-     val += (j-i+1) * temp_val;
-     if (l) {
-       l->temp_val += temp_val;
-       r->temp_val += temp_val;
-     }
-     temp_val = 0;
-   }
- void increase(int _i, int _j, int _inc) {
-   visit();
-   if (_i <= i && j <= _j) {
-     temp_val += _inc;
-     visit();
-   } else if (_j < i or j < _i) {
-     // do nothing
-   } else {
-     l->increase(_i, _j, _inc);
-     r->increase(_i, _j, _inc);
-     val = l->val + r->val;
-   }
- int sum(int _i, int _j) {
-   visit();
-   if (_i <= i and j <= _j) {
-     return val;
-   }
}
```

```
} else if (_j < i || j < _i) {
-   return 0;
- } else {
-   return l->sum(_i, _j) + r->sum(_i, _j);
} }
```

2.3.4. Persistent (Point-update).

```
struct node { int l, r, lid, rid, val; };
struct segtree {
- node *nodes;
- int n, node_cnt = 0;
- segtree(int n) {
-   this->n = n;
-   nodes = new node[2*n];
- int build(vi &ar, int l, int r) {
-   if (l > r) return -1;
-   int id = node_cnt++;
-   nodes[id].l = l;
-   nodes[id].r = r;
-   if (l == r) {
-     nodes[id].lid = -1;
-     nodes[id].rid = -1;
-     nodes[id].val = ar[l];
-   } else {
-     int m = (l + r) / 2;
-     nodes[id].lid = build(l, m);
-     nodes[id].rid = build(m+1, r);
-     nodes[id].val = nodes[nodes[id].lid].val +
-       nodes[nodes[id].rid].val;
-   }
-   return id;
- int update(int idx, int delta, int id) {
-   if (id == -1) return -1;
-   if (idx < nodes[id].l or nodes[id].r < idx) return id;
-   int nid = node_cnt++;
-   nodes[nid].l = nodes[id].l;
-   nodes[nid].r = nodes[id].r;
-   nodes[nid].lid = update(idx, v, nodes[id].lid);
-   nodes[nid].rid = update(idx, v, nodes[id].rid);
-   nodes[nid].val = nodes[id].val + delta;
-   return nid;
- int query(int id, int l, int r) {
-   if (r < nodes[id].l or nodes[id].r < l) return 0;
-   if (l <= nodes[id].l and nodes[id].r <= r) return nodes[id].val;
-   return query(nodes[id].l, l, r) + query(nodes[id].r, l, r);
} }
```

2.4. Sparse Table.

2.5. Sqrt Decomposition.

2.6. Treap.

2.6.1. Explicit.

2.6.2. Implicit.

2.6.3. Persistent.

2.7. Union Find.

```
struct union_find {
- vi p; union_find(int n) : p(n, -1) {
- int find(int x) { return p[x] < 0 ? x : p[x] = find(p[x]); }
- bool unite(int x, int y) {
-   int xp = find(x), yp = find(y);
-   if (xp == yp) return false;
-   if (p[xp] > p[yp]) swap(xp,yp);
-   p[xp] += p[yp], p[yp] = xp;
-   return true;
- int size(int x) { return -p[find(x)]; }
}
```

3. GRAPHS

Using adjacency list:

```
struct graph {
- int n;
- vii *adj;
- int *dist;
- graph(int n) {
-   this->n = n;
-   adj = new vii[n];
-   dist = new int[n];
- void add_edge(int u, int v, int w) {
-   adj[u].push_back({v, w});
-   /*adj[v].push_back({u, w});*/
}
```

Using adjacency matrix:

```
struct graph {
- int n;
- int **mat;
- graph(int n) {
-   this->n = n;
-   mat = new int*[n];
-   for (int i = 0; i < n; ++i) {
-     mat[i] = new int[n];
-     for (int j = 0; j < n; ++j)
-       mat[i][j] = INF;
-     mat[i][i] = 0;
-   }
- void add_edge(int u, int v, int w) {
-   mat[u][v] = std::min(mat[u][v], w);
-   /*mat[v][u] = std::min(mat[v][u], w);*/
}
```

Using edge list:

```
struct edge {
- int u, v, w;
- edge(int u, int v, int w) : u(u), v(v), w(w) {}
- const bool operator <(const edge &other) const {
-   return w < other.w;
}
struct graph {
- int n;
- std::vector<edge> edges;
- graph(int n) : n(n) {}
- void add_edge(int u, int v, int w) {
-   edges.push_back(edge(u, v, w));
}
```

3.1. Single-Source Shortest Paths.

```
3.1.1. Dijkstra.
#include "graph_template_adjlist.cpp" -----//76
void dijkstra(int s, int n, int *dist, vii *adj) { -----//ad
-   for (int u = 0; u < n; ++u) -----//24
-   dist[u] = INF; -----//6d
-   dist[s] = 0; -----//63
-   std::priority_queue<ii, vii, std::greater<ii> > pq; -----//e0
-   pq.push({0, s}); -----//a3
-   while (!pq.empty()) { -----//9b
-       int u = pq.top().second; -----//10
-       int d = pq.top().first; -----//7b
-       pq.pop(); -----//15
-       if (dist[u] < d) -----//b1
-           continue; -----//27
-       dist[u] = d; -----//96
-       for (auto &e : adj[u]) { -----//24
-           int v = e.first; -----//94
-           int w = e.second; -----//0f
-           if (dist[v] > dist[u] + w) { -----//ca
-               dist[v] = dist[u] + w; -----//d0
-               pq.push({dist[v], v}); } } } } -----//4a

3.1.2. Bellman-Ford.
#include "graph_template_adjlist.cpp" -----//76
void bellman_ford(int s, int n, int *dist, vii *adj) { -----//f4
-   for (int u = 0; u < n; ++u) -----//2c
-   dist[u] = INF; -----//ba
-   dist[s] = 0; -----//50
-   for (int i = 0; i < n-1; ++i) -----//a0
-   for (int u = 0; u < n; ++u) -----//94
-   for (auto &e : adj[u]) -----//96
-   if (dist[u] + e.second < dist[e.first]) -----//3b
-   dist[e.first] = dist[u] + e.second; } -----//b4
// you can call this after running bellman_ford() -----//06
bool has_neg_cycle(int n, int *dist, vii *adj) { -----//26
-   for (int u = 0; u < n; ++u) -----//2f
-   for (auto &e : adj[u]) -----//e9
-   if (dist[e.first] > dist[u] + e.second) -----//b4
-   return true; -----//ba
-   return false; } -----//7b
```

3.2. All-Pairs Shortest Paths.

```
3.2.1. Floyd-Washall.
#include "graph_template_adjmat.cpp" -----//6e
void floyd_warshall(int n, int **mat) { -----//af
-   for (int k = 0; k < n; ++k) -----//61
-   for (int i = 0; i < n; ++i) -----//d3
-   for (int j = 0; j < n; ++j) -----//43
-   if (mat[i][k] + mat[k][j] < mat[i][j]) -----//a3
-   mat[i][j] = mat[i][k] + mat[k][j]; } -----//99
```

3.3. Strongly Connected Components.

3.3.1. Kosaraju.

3.4. Cut Points and Bridges.

3.5. Biconnected Components.

```
3.5.1. Bridge Tree.
3.5.2. Block-Cut Tree.
3.6. Minimum Spanning Tree.
3.6.1. Kruskal.
3.6.2. Prim.
3.7. Topological Sorting.
3.8. Euler Path.
3.9. Bipartite Matching.
3.9.1. Alternating Paths Algorithm.
3.9.2. Hopcroft-Karp Algorithm.
3.10. Maximum Flow.
3.10.1. Edmonds-Karp.

- Minimize something instead of maximizing
- Immediately enforce necessary conditions. (All values greater than 0? Initialize them all to 1)
- Add large constant to negative numbers to make them positive
- Counting/Bucket sort

11. FORMULAS

- **Legendre symbol:** $(\frac{a}{b}) = a^{(b-1)/2} \pmod{b}$, b odd prime.
- **Heron’s formula:** A triangle with side lengths a, b, c has area $\sqrt{s(s-a)(s-b)(s-c)}$ where $s = \frac{a+b+c}{2}$.
- **Pick’s theorem:** A polygon on an integer grid strictly containing i lattice points and having b lattice points on the boundary has area $i + \frac{b}{2} - 1$. (Nothing similar in higher dimensions)
- **Euler’s totient:** The number of integers less than n that are coprime to n are $n \prod_{p|n} \left(1 - \frac{1}{p}\right)$ where each p is a distinct prime factor of n .
- **König’s theorem:** In any bipartite graph $G = (L \cup R, E)$, the number of edges in a maximum matching is equal to the number of vertices in a minimum vertex cover. Let U be the set of unmatched vertices in L , and Z be the set of vertices that are either in U or are connected to U by an alternating path. Then $K = (L \setminus Z) \cup (R \cap Z)$ is the minimum vertex cover.
- A minumum Steiner tree for n vertices requires at most $n-2$ additional Steiner vertices.
- The number of vertices of a graph is equal to its minimum vertex cover number plus the size of a maximum independent set.
- **Lagrange polynomial** through points $(x_0, y_0), \dots, (x_k, y_k)$ is $L(x) = \sum_{j=0}^k y_j \prod_{\substack{0 \leq m \leq k \\ m \neq j}} \frac{x-x_m}{x_j-x_m}$
- **Hook length formula:** If λ is a Young diagram and $h_\lambda(i, j)$ is the hook-length of cell (i, j) , then then the number of Young tableaux $d_\lambda = n! / \prod h_\lambda(i, j)$.
- **Möbius inversion formula:** If $f(n) = \sum_{d|n} g(d)$, then $g(n) = \sum_{d|n} \mu(d) f(n/d)$. If $f(n) = \sum_{m=1}^n g(\lfloor n/m \rfloor)$, then $g(n) = \sum_{m=1}^n \mu(m) f(\lfloor \frac{n}{m} \rfloor)$.
- #primitive pythagorean triples with hypotenuse $< n$ approx $n/(2\pi)$.
- **Frobenius Number:** largest number which can’t be expressed as a linear combination of numbers a_1, \dots, a_n with non-negative coefficients. $g(a_1, a_2) = a_1 a_2 - a_1 - a_2$, $N(a_1, a_2) = (a_1 - 1)(a_2 - 1)/2$. $g(d \cdot a_1, d \cdot a_2, a_3) = d \cdot g(a_1, a_2, a_3) + a_3(d - 1)$. An integer $x > (\max_i a_i)^2$ can be expressed in such a way iff. $x \mid \gcd(a_1, \dots, a_n)$.

11.1. Physics.

- **Snell’s law:** $\frac{\sin \theta_1}{v_1} = \frac{\sin \theta_2}{v_2}$

11.2. **Markov Chains.** A Markov Chain can be represented as a weighted directed graph of states, where the weight of an edge represents the probability of transitioning over that edge in one timestep. Let $P^{(m)} = (p_{ij}^{(m)})$ be the probability matrix of transitioning from state i to state j in m timesteps, and note that $P^{(1)}$ is the adjacency matrix of the graph. **Chapman-Kolmogorov:** $p_{ij}^{(m+n)} = \sum_k p_{ik}^{(m)} p_{kj}^{(n)}$. It follows that $P^{(m+n)} = P^{(m)} P^{(n)}$ and $P^{(m)} = P^m$. If $p^{(0)}$ is the initial probability distribution (a vector), then $p^{(0)} P^{(m)}$ is the probability distribution after m timesteps.

The return times of a state i is $R_i = \{m \mid p_{ii}^{(m)} > 0\}$, and i is *aperiodic* if $\gcd(R_i) = 1$. A MC is aperiodic if any of its vertices is aperiodic. A MC is *irreducible* if the corresponding graph is strongly connected.

A distribution π is stationary if $\pi P = \pi$. If MC is irreducible then $\pi_i = 1/\mathbb{E}[T_i]$, where T_i is the expected time between two visits at i . π_j/π_i is the expected number of visits at j in between two consecutive visits at i . A MC is *ergodic* if $\lim_{m \rightarrow \infty} p^{(0)} P^m = \pi$. A MC is ergodic iff. it is irreducible and aperiodic.

A MC for a random walk in an undirected weighted graph (un-weighted graph can be made weighted by adding 1-weights) has $p_{uv} = w_{uv} / \sum_x w_{ux}$. If the graph is connected, then $\pi_u = \sum_x w_{ux} / \sum_v \sum_x w_{vx}$. Such a random walk is aperiodic iff. the graph is not bipartite.

An *absorbing* MC is of the form $P = \begin{pmatrix} Q & R \\ 0 & I_r \end{pmatrix}$. Let $N = \sum_{m=0}^\infty Q^m = (I_t - Q)^{-1}$. Then, if starting in state i , the expected number of steps till absorption is the i -th entry in $N1$. If starting in state i , the probability of being absorbed in state j is the (i, j) -th entry of NR . Many problems on MC can be formulated in terms of a system of recurrence relations, and then solved using Gaussian elimination.

11.3. **Burnside’s Lemma.** Let G be a finite group that acts on a set X . For each g in G let X^g denote the set of elements in X that are fixed by g . Then the number of orbits

$$|X/G| = \frac{1}{|G|} \sum_{g \in G} |X^g|$$

$$Z(S_n) = \frac{1}{n} \sum_{l=1}^n a_l Z(S_{n-l})$$

11.4. **Bézout’s identity.** If (x, y) is any solution to $ax + by = d$ (e.g. found by the Extended Euclidean Algorithm), then all solutions are given by

$$\left(x + k \frac{b}{\gcd(a, b)}, y - k \frac{a}{\gcd(a, b)}\right)$$

11.5. Misc.

11.5.1. *Determinants and PM.*

$$\det(A) = \sum_{\sigma \in S_n} \text{sgn}(\sigma) \prod_{i=1}^n a_{i, \sigma(i)}$$

$$\text{perm}(A) = \sum_{\sigma \in S_n} \prod_{i=1}^n a_{i, \sigma(i)}$$

$$\begin{aligned} pf(A) &= \frac{1}{2^n n!} \sum_{\sigma \in S_{2n}} \text{sgn}(\sigma) \prod_{i=1}^n a_{\sigma(2i-1), \sigma(2i)} \\ &= \sum_{M \in \text{PM}(n)} \text{sgn}(M) \prod_{(i,j) \in M} a_{i,j} \end{aligned}$$

11.5.2. *BEST Theorem.* Count directed Eulerian cycles. Number of OST given by Kirchoff’s Theorem (remove r/c with root) $\# \text{OST}(G, r) \cdot \prod_v (d_v - 1)!$

11.5.3. *Primitive Roots.* Only exists when n is $2, 4, p^k, 2p^k$, where p odd prime. Assume n prime. Number of primitive roots $\phi(\phi(n))$ Let g be primitive root. All primitive roots are of the form g^k where $k, \phi(p)$ are coprime.

k -roots: $g^{i \cdot \phi(n)/k}$ for $0 \leq i < k$

11.5.4. *Sum of primes.* For any multiplicative f :

$$S(n, p) = S(n, p-1) - f(p) \cdot (S(n/p, p-1) - S(p-1, p-1))$$

11.5.5. *Floor.*

$$\lfloor \lfloor x/y \rfloor / z \rfloor = \lfloor x/(yz) \rfloor$$

$$x \% y = x - y \lfloor x/y \rfloor$$

PRACTICE CONTEST CHECKLIST

- How many operations per second? Compare to local machine.
- What is the stack size?
- How to use printf/scanf with long long/long double?
- Are `__int128` and `__float128` available?
- Does MLE give RTE or MLE as a verdict? What about stack overflow?
- What is `RAND_MAX`?
- How does the judge handle extra spaces (or missing newlines) in the output?
- Look at documentation for programming languages.
- Try different programming languages: C++, Java and Python.
- Try the submit script.
- Try local programs: `i?python[23]`, `factor`.
- Try submitting with `assert(false)` and `assert(true)`.
- Return-value from `main`.
- Look for directory with sample test cases.
- Make sure printing works.
- Remove this page from the notebook.
